Homework 1

The command line and the gui accomplish the same tasks in different ways. The command line forces me to tell the computer what to do by typing in commands. On the other hand, The gui gives me a bunch of buttons, pictures, and forms that tell the computer what to do. The command line is minimal and doesn't display much information other than the path to the working directory. Meanwhile, the gui is cluttered with all the different operations I can perform, as well as a list of all the other locations on my computer. The gui is tailored to guide the user along whatever task that needs to be done, while the command line assumes that the user already knows what to do and how to do it.
